

# HANGCHENG ZHAO

The Wharton School, University of Pennsylvania

**Address:**

3730 Walnut Street  
Philadelphia, PA, 19104

**Email:** [zhaohc@wharton.upenn.edu](mailto:zhaohc@wharton.upenn.edu)**Website:** <https://hangcheng-zhao.github.io>

## EDUCATION

---

**The Wharton School, University of Pennsylvania**

*July 2020 - May 2025 (Expected)*

Ph.D. in Quantitative Marketing

*Dissertation Committee:* Prof. Ron Berman (Chair), Prof. Eric Bradlow, Prof. Pinar Yildirim

**University of Chicago**

*August 2018 - August 2019*

Master in Economics

*Thesis Advisor:* Philip Reny

**Tsinghua University, Beijing, China**

*August 2014 - July 2018*

Bachelor in Economics

## RESEARCH INTERESTS

---

Pricing, Algorithmic Decision-Making, Reinforcement Learning, Recommendation Algorithms, Platforms, Online Marketing, Empirical IO

## WORKING PAPERS

---

**Algorithmic Collusion of Pricing and Advertising on E-commerce Platforms (*Job Market Paper*)**

With Ron Berman (University of Pennsylvania)

**Ridge Distributions and Information Design in Simultaneous All-Pay Auction Contests** [\[SSRN\]](#)

With Zhonghong Kuang (Remin University of China) and Jie Zheng (Shandong University)

- Minor Revision at *Games and Economic Behavior*

**Analyzing Healthcare Price Transparency: Will Patients Shop for Services More Effectively?** [\[SSRN\]](#)

With Ron Berman (University of Pennsylvania)

- Under Revision

**Strategic Recommendation Algorithms: Overselling and Demarketing Information Designs** [\[SSRN\]](#)

With Ron Berman (University of Pennsylvania) and Yi Zhu (University of Minnesota)

- Under Revision

## CONFERENCE PRESENTATIONS

---

**Algorithmic Collusion of Pricing and Advertising on E-commerce Platforms**

- 4th Annual AI in Management (AIM) Conference *Los Angeles, CA, March 2024*
- 14th Annual Theory + Practice of Marketing Conference *Austin, TX, May 2024*
- 2024 INFORMS Marketing Science Conference *Sydney, Australia, June 2024 (scheduled)*

## Analyzing Healthcare Price Transparency: Will Patients Shop for Services More Effectively?

- 2023 INFORMS Marketing Science Conference *Miami, FL, June 2023*

## Ridge Distributions and Information Design in Simultaneous All-Pay Auction Contests

- ASSA 2020 Annual Meeting *San Diego, CA, January 2020*
- 30th International Conference on Game Theory *Stony Brook, NY, July 2019*

## RESEARCH AND PROFESSIONAL EXPERIENCE

---

**Ph.D. Economist Intern** *July 2023 - September 2023*  
HP, Inc., Pricing Analytics Group

**Research Assistant to Prof. Ron Berman and Prof. Pinar Yildirim** *July 2019 - June 2020*  
The Wharton School, University of Pennsylvania

**Research Assistant to Prof. Richard Hornbeck** *October 2018 - June 2019*  
Booth School of Business, University of Chicago

## TEACHING EXPERIENCE

---

**The Wharton School, University of Pennsylvania, Philadelphia, PA**

**Teaching Assistant to Prof. Jagmohan Raju** *Summer 2022, Spring 2023, Spring 2024*

- MKTG 7540 Pricing Policy (MBA, WEMBA)

## HONORS AND AWARDS

---

ISMS Marketing Science Doctoral Consortium Fellow *2024*

Mack Institute Research Fellowship *2023*

Analytics at Wharton Research Funding *2023*

George James Travel Award for the Wharton Doctoral Program *2023*

Wharton INSEAD Alliance Doctoral Student Short - Term Visit Award *2023*

Ph.D. Program Fellowship, the Wharton School, University of Pennsylvania *2020-Present*

University of Chicago Scholarship for Master of Arts Social Sciences Program *2018-2019*

“Top Open” Student Overseas Research Grant, Tsinghua University *2017*

Undergraduate Student Academic Research Grant, Tsinghua University *2017-2018*

## TECHNICAL SKILLS

---

**Programming Languages**      Stata, C++/C, R, Python, Matlab, Mathematica, SQL, Amazon AWS

## ABSTRACTS

---

### **Algorithmic Collusion of Pricing and Advertising on E-commerce Platforms (*Job Market Paper*)**

With Ron Berman (University of Pennsylvania)

Firms have been adopting learning algorithms to drive automatic decision making such as setting product prices and setting bids in online ad auctions. One concern that arises when firms compete using such algorithms is that of tacit collusion—the algorithms learn to settle on higher than competitive prices which increase firm profits, but hurt consumers. We investigate the impact of such learning algorithms to determine if they are always harmful to consumers, but in a setting with two-dimensional decisions, because many firms need to decide on pricing and bidding together. Our analysis uses a multi-agent reinforcement learning simulation of the Q-learning algorithm that is compared to analytical results from a game theoretical model. Our main findings are that algorithms can facilitate outcomes that are beneficial for both consumers, sellers, and even the platform when consumers have heterogeneous search costs. The intuition is that algorithms learn to coordinate on lower bids, which lowers advertising costs, leading to lower prices for consumers and enlarging the demand on the platform. We also analyze a large-scale product dataset from Amazon.com and find robust evidence of substantial consumer search costs, suggesting that the beneficial outcomes of algorithmic pricing can hold for most, if not all product markets we analyze. We show that even if the platform responds strategically by adjusting the ad auction reserve price or the sales commission rate, the beneficial outcomes for both sellers and consumers are likely to persist.

### **Analyzing Healthcare Price Transparency: Will Patients Shop for Services More Effectively? [\[SSRN\]](#)**

With Ron Berman (University of Pennsylvania)

Recently, the US mandated healthcare price transparency to facilitate easier comparison of healthcare prices. However, the potential effectiveness of this policy is an open question. We use a large-scale health insurance claims dataset to estimate the potential maximum savings from price transparency. We focus on short-term, demand-side estimates, where patients can shop around and switch to cheaper providers. We analyze the set "shoppable" services whose price information must be reported

online. Initially, our data points to a large potential for savings due to a large degree of price dispersion. However, when viewed from the consumer shopping perspective, even the most optimistic estimates of potential savings become limited. The reasons are that the location and insurance network of the patient, the structure of healthcare insurance payments, and the information made available by the transparency rule lower patients' incentive to save. We find that the best-case scenario for patients' out-of-pocket savings from price - shopping is 3% of the total cost on average. Our analysis suggests that the existing estimates in the literature might be overestimated, as they overlook the consumer shopping perspective. Hence, patients' potential savings and the demand-side impact of the transparency rule might not be as impactful as initially hoped for.

### **Strategic Recommendation Algorithms: Overselling and Demarketing Information Designs** [\[SSRN\]](#)

With Ron Berman (University of Pennsylvania) and Yi Zhu (University of Minnesota)

We analyze recommendation algorithms that firms can engineer to strategically provide information to consumers about products with uncertain matches to their tastes. Monopolists who cannot alter prices can design recommendation algorithms to oversell, i.e., that recommend products even if they are not a perfect fit, instead of algorithmically recommending perfectly matching products. However, when prices are endogenous or when competition is rampant, firms opt to lower their persuasive claims and instead choose to fully reveal the product's match (i.e., maximize recall and precision). As competition strengthens, the algorithms will shift to demarket their products, i.e., under-recommend highly fitting products, in order to soften competition. When a platform designs a recommendation algorithm for products sold by third party sellers we find that demarketing might be a more prevalent strategy of the platform. Overselling entails designing algorithms that recommend badly fitting products to consumers, which would lower the consumers' ex-ante willingness to pay, and thus increase competition among the sellers and lower the platform's profit. Demarketing, in contrast, softens the competition among sellers from the information perspective, which can be lucrative for the platform.

### **Ridge Distributions and Information Design in Simultaneous All-Pay Auction Contests** [\[SSRN\]](#)

With Zhonghong Kuang (Remin University of China) and Jie Zheng (Shandong University)

Two privately informed contestants compete in a contest, and the organizer ex-ante designs a public anonymous disclosure policy to maximize contestants' total effort. We fully characterize ridge distributions, under which the organizer achieves the first best outcome in equilibrium: the allocation is efficient, and the entire surplus goes to the organizer. When the prior is a mixture of a ridge distribution and a perfectly correlated distribution, the first-best outcome is achievable by the signal that solely generates ridge distributions as posteriors.
